

Testing the overall bending of glass

# Glas Natter appreciates quality

The insulating glass manufacturer Glas Natter, based in Regensburg, has decided in favour of a version of the Softsolution LineScanner for testing the overall bending of glass. Despite the complex testing system, it is simple to operate.

According to Softsolution, the acceptance of the first LineScanner by the Isolar Glas Ostbayern company took place at the end of May 2016. The LineScanner would have the task of testing the quality of individual glass panes on a fully automatic insulating glass line at the Lisecc company. Together with Managing Director Rosemarie Natter and Works Manager Gerhard Köhl, Softsolution had initiated a pilot project for testing the overall bending of glass. This – according to the provider's own information – launched the first successful installation of the new testing method worldwide in the market.

In addition, the LineScanner is also equipped with the latest software version, allowing simple setting of the sensitivity of the LineScanner.

**Testing** the overall warpage of the glass is a further development of the LineScanner.

According to Softsolution, it is possible to accurately define what artefacts should be displayed or not displayed as defects using a slider and preview. "The LineScanner has been in operational use since May 2016 to our full satisfaction and even exceeds the requirements we have

defined for it", states Rosemarie Natter. "We attach great value to the quality of our products. This is why we decided to realise the additional option of testing for overall bending", she adds.

## Simple to use

Works Manager Gerhard Köhl is also enthusiastic about the further development: "A complete success – I am satisfied with the results and the cooperation with Softsolution. It is noticeable that Softsolution has a strong interest in delivering top-quality products, which are as simple as possible to install and operate. It is of fundamental importance for us to train new operators of the system as quickly as possible", according to Köhl. "The Softsolution LineScanner is entirely aimed at achieving this problem-free operation".
